Exercise 1

1. C
2. E
3. D
4. E
5. C

Exercise 2

1. Bats are animal that carry many disease. The disease they carry is a dangerous type, like nipah, ebola, and etc. in the video, we see how the bats are so resilient to infect and why the bats don't die.
2. In a few notable exceptions, bats love company. Different kinds of bats often roost together in huge numbers and close quarters, which helps viruses spread not just between individuals, but also between species. Most infected bats don't die. They live pretty normal bat lives, flapping around and giving the viruses time to spread. So, that's why bats do appear to carry more human-killing diseases than pretty much any other animal.
3. People need bats for insect control and pollination and they could even learn some immune tricks from them like how to be really good at not getting cancer! And the most important benefit of bats is they aren't the biggest carriers of human disease.
4. Because they flapping around and giving the viruses time to spread.
5. To keep myself and people around me stay healthy, I can suggest to wash our hands at all times, wear a mask when we are not healthy (cough or runny nose), consume nutritious foods such as vegetables and fruit, exercise diligently, and get enough rest.
